Needle Arthroscopy

The NanoScope is an arthroscopy imaging system that provides the surgeon with a *minimally invasive option* to diagnose disease processes such as:

- meniscal tears
- biceps tears
- synovitis
- fragmented medial coronoid disease
- and many more

**Latest Diagnostic tool**

Needle arthroscopy is an alternative diagnostic tool that allows the surgeon to get a *better visualization of the damaged joint(s)*. Compared to MRI, it requires heavy sedation rather than general anesthesia.

**Faster Results/Cost Effective**

This is a precise, image-guided visualization of the disease processes within each joint(s) in question. Patients can **go home the same day** as the procedure and owners can gain more knowledge about their pet's joint disease than with MRI alone. The cost of the Needle arthroscopy is roughly 1/3 the cost of a traditional one site MRI.
